AUTHOR: Izbalykov, D. A.

TITLE: On a Calculation of a Pressure Pneumatic Transportation System, with an Ejector

PERIODICAL: Tsement, 1959, Nr 5, pp 24 - 27 (USSR)

ABSTRACT: The author states that in the last few years experiments were undertaken into the use of the above system, operating either without mechanical feeders, in the case of the Sterlitamakiy tsementnyy zavod (Sterlitamak Cement Plant), or with mechanical feeders, as in the case of Kuybyshevgidrostroy. In both cases, the ejector pumps were found to be more economical and reliable in operation than the pneumatic worm conveyors. The author considers it reasonable to establish a method for the calculation of the ejector pumps for pressure pneumatic transportation. The starting point for such a calculation is the presumed productivity of the enterprise in question, expressed in tons per hour. There are 1 diagram and 1 table.

TITLE: Using computers in the analysis of the multi-factor process of the deposition of a percolation cover on river beds

SOURCE: Izvestiya vysshikh uchebnykh zavedeniy. Energetika, no. 9, 1965, 74-81

TOPIC TAGS: hydroelectric power plant, electronic computer, hydraulic engineering, drainage system/Ural-2 electronic computer

ABSTRACT: As the river bed is covered by a blanket of rock debris, part of the river discharge inevitably percolates through the body of this blanket. This percolation plays the role of an additional water drain and hence facilitates the hydraulic conditions for covering the river bed. Thus, when regulating the Volga in the region of the Hydroelectric Power Station imeni 22nd CPSU Congress, the upper part of the blanket consisted of an extremely permeable debris of chunks of concrete. As a result during the decisive stage of blanketing of the bed, about 50% of the river's discharge percolated through the blanket. On blanketing the bed of the Tula River during the construction of Verkhne-Tulomskaya Hydroelectric Power Station the river's discharge (60 m³/sec) entirely percolated through the blanket. In this connection, the author shows how the multifactor process of blanketing a river bed with a percolation cover can be described by means of a number of graphs relating the dimensionless characteristics and parameters of the cover with the aid of an Ural-2

PURPOSE: The book is intended for technicians in all branches of heat engineering.

COVERAGE: This book presents the development of the basic branches of heat engineering in the Soviet Union and it is the first volume of 3 volumes entitled History of Power Technology in the USSR. The first chapter gives a concise history of the development of heat engineering from its very beginning to the middle of the 19th Century when the fundamentals of the theoretical heat engineering were established. A detailed description of the development of heat engineering in pre-Revolutionary Russia is given in Ch. 2 to 5 and its status before 1917 is described. In the main part of the volume, Ch. 6 to 16, the development of various branches of the Soviet heat engineering is presented. The theoretical fundamentals of heat engineering, of manufacturing boilers, turbine installations of heat power plants, district heating, heat control, automation of thermal processes, and cooling techniques are covered extensively. Each chapter is supplemented with a bibliography. The book is illustrated with photographs, charts and diagrams, worked out by the authors of the respective chapters. At the end of the book there is a chronological list of significant events in the development of heat engineering.

TITLE: Participation of the Moscow Power-Engineering Institute in Hydraulic Investigations of Large Soviet Hydro-Power Developments

PERIODICAL: Tr. Mosk. energ. in-ta, 1958, Nr 30, pp 5-13

ABSTRACT: A short characterization is given of the work done by the Moscow Power Engineering Institute since 1953 on orders of large hydro-power developments (Gor'kiy station, Kuybyshev station, and others). Hydraulic computations and experiments were made for the projects that involved building of hydro developments and powerhouses integral with the dams, high-head spillways, etc. The above work helped in solving the complex interrelated hydraulic problems of building and operating a hydro development.

Decomposition potentials of metallic chlorides in fused AlCl_3 and AlCl_3KCl as solvents. V. A. Izraelov and N. G. Tsimovnik (Mém. Inst. Chim. Ukrain. Acad. Sci., 1937, 4, 67—70).—The decomp. potentials of CuCl_2 , SnCl_2 , ZnCl_2 , AgCl , SbCl_3 , and BiCl_3 in fused AlCl_3 , and in fused AlCl_3KCl have been determined. The order found in these two solvents is Al , Cl , Ag , Sb , Sn , Bi ; in AlBr_3 Sn stands before Sb , the order being otherwise unchanged. The large difference in the v.a.s. for SnCl_2 or SnBr_2 in different solvents is due to secondary reactions such as depolarisation by formation of SnCl_4 at the anode.

Decomposition potentials of fused halides and their binary systems with a common cation. V. A. Izagoy and N. O. Tschovnik (Met. Inst. Chem. Ukrain. Acad. Sci., 1937, 4, 71-83).—The decomp. potential of a halide is scarcely changed by the addition of another halide of the same metal. The decomp. potentials of halides of Sn and Sb, and to a smaller extent of Bi, are altered by the addition of $AlCl_3$ or $AlBr_3$. Mixtures of two halides of the same metal do not conduct if their components are non-conductors, but the systems AlX_3-SbX_3 and AlX_3-HgX_2 ($X = Cl, Br$) are conductors, although their components are not.

F. J. G.

Ed.: T.A. Prusakova.

PURPOSE: This book is intended for chemical and electrical engineers, physicists, metallurgists and researchers interested in various aspects of electrochemistry.

COVERAGE: The book contains 127 of the 138 reports presented at the Fourth Conference on Electrochemistry sponsored by the Department of Chemical Sciences and the Institute of Physical Chemistry, Academy of Sciences of the USSR. The collection pertains to different branches of electrochemistry: chemical kinetics, double layer theories and galvanic processes in metal electrodeposition and industrial electrolysis. The majority of reports are given at the end of each division. The majority of reports not included here have been published in periodical literature. No personalities are mentioned. References are given at the end of most of the articles.

AUTHORS: Izbekova, O. V., Belinskaya, L. S., Kudra, O. K.

TITLE: A study of the nickel-pyrophosphate bath

PERIODICAL: Ukrainskiy khimicheskiy zhurnal, v. 27, no. 1, 1961, 118-121

TEXT: The authors have studied the usability of nickel-pyrophosphate baths which in comparison to cyanide baths have the advantages of being harmless and sufficiently stable. They studied the influence of component concentration, temperature and additives on the quality of the nickel deposit. The following additives were tested: H_2SO_4 , HCl, KCl, formalin, phenol, peptone, Seignette salt and urea. The tests⁴ were carried out in a single bath or in several baths connected in series (6 x 2.5 x 9 cm, 100 ml volume) with plate-shaped nickel- and copper anodes. The back part of the anodes was isolated by a layer of paraffin or varnish. The electrode potentials were measured by means of a ПНТБ-1 (PPTV-1) potentiometer against a saturated calomel electrode as reference and reduced to a normal hydrogen electrode. The electrolyte composition was so chosen as to give clear and stable solutions. This was the case with solutions consisting

of 0.05-0.3 mol/l NiSO_4 mixed with solutions $\text{K}_4\text{P}_2\text{O}_7/\text{NiSO}_4$ of molar ratio not below 2. At a molar ratio of 2-4, the $\text{K}_4\text{P}_2\text{O}_7$ concentration had no influence on the appearance of the nickel deposit on copper cathodes at 20°C . Variation of the SO_4 concentration within wide limits affects neither the quality of the nickel deposit nor the current yield. The best coatings were obtained at NiSO_4 concentrations of 0.17-0.30 mol/l and a current density of 0.5 - 1.0 a/dm². At current densities around 0.1 a/dm² the deposit is whitish with uncovered areas. At 2-3 a/dm², the deposits are black and at yet higher current densities nickel is not deposited at all. A temperature increase widens the permissible current density range. Though hydrogen was discharged simultaneously with nickel, pitting did not occur. The authors ascribe this to the thorough agitation of the electrolyte by the hydrogen bubbles and to the high negative cathode potential. Fig. 1 illustrates the reduction in current yield at 20°C produced by increasing the current density and pyrophosphate concentration. This effect gradually diminishes on further raising the current density and pyrophosphate excess. At lower current densities (approx-

S/073/61/027/001/002/002
B103/B216

mately 0.1 a/dm^2) the current yield is hardly affected by the nickel concentration. At higher current densities the yields increase with increasing NiSO_4 concentration. At 40 and 60°C and 0.2 mol/l of NiSO_4 the yield is increased considerably by a temperature rise. The authors also found that the diffusibility of pyrophosphate electrolytes (according to the method by Field) is always much greater than that of acidic electrolytes. In service of pyrophosphate baths consisting only of NiSO_4 and $\text{K}_4\text{P}_2\text{O}_7$ the nickel anodes become strongly passive and the current yield drops to zero. The authors, however, used the initially mentioned additives. At a current density of 1 a/dm^2 , 2.5 g/l of KCl completely eliminated anodic passivity without detrimental effect to the quality of the deposit. At higher current densities the anode is only partially activated by the same amount of KCl and the current yields fall short of 100%. In this case the anode is usually covered by a dark incrustation. At higher temperatures smaller quantities of KCl have a lower activating effect, but here too, the anodic current yield at 2.5-5 g/l of KCl is nearly 100%. Fig. 2 shows the influence of additives on the cathodic polarization. The bath contained 0.2 M of NiSO_4 at a molar ratio of

Card 3/6

B103/B212

$K_4P_2O_7/NiSO_4 = 2.5$ at $20^\circ C$. The zero curve corresponds to polarization in the absence of additives. It is apparent from the curves that up to 10 ml/l of formalin (curve 1) produces an average cathode potential increase of 100 mv and up to 50 ml/l an increase of 150 mv (curve 2). Addition of phenol somewhat reduces polarization at low current densities (up to 1 a/dm²). The curves 3 and 4 were taken in presence of 1 and 10 g/l of phenol. The favorable effect of phenol is apparent in the increased luster of the coatings. Addition of 1 g/l of peptone or 1 g/l of urea also increases the cathode potential by 70-75 mv, and 10 g/l of peptone produce an increase of 110-120 mv. 10 g/l of Seignette salt reduce polarization by 30-35 mv. There are 2 figures and 5 references: 2 Soviet-bloc and 3 non-Soviet-bloc. The reference to English language publications reads as follows: Vaid J., Rama Char T. L., J. Electrochem. TITLE: Continuous furnace for shield annealing

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 11, 1962, 10, abstract
11B56P (Pol. pat., no. 44895, September 21, 1961)

TEXT: A continuous vertical type inverted U-shaped furnace for shield
annealing consists of corresponding heating through compartments with electrical
heating. A chain conveyer with suspenders (or baskets) for annealed pieces pas-
ses through the furnace, whereby in the lower part of the furnace the conveyer
passes through gates with attachments filled with a liquid (e.g. water). When
the workpieces are charged the conveyer with suspenders sinks into the liquid
and emerges already in the heating compartments. In its surface part the liquid
is in a state near to boiling and the vapor produces the necessary shield in the

2640. Clinical and functional assessment of surgical treatment of mitral stenosis (A follow-up study) (Russian text) IZHINSKI A. L. and BLESTRINA T. G. *Vestn. Khir.* 1958, 81/11 (33-40) Tables 4

In 110 patients treatment by mitral commissurotomy is evaluated by a follow-up of from 6 months to 4 yr. A favourable outcome was found to be present in 86% of cases. The respiratory function was found to be excellent in 27 patients, good in 12 and fair in 6 cases. The unfavourable results are found to depend on: (1) a failure of the commissurotomy itself, (2) a rather late recrudescence of rheumatic infection, (3) marked dystrophic myocardial changes, (4) intercurrent diseases and (5) clear-cut symptoms of 'the 2nd barrier' present before operation. This adjuvant classification gives a more reliable appraisal of the patient's condition before surgery and has an outstanding significance for the prognosis of late results. A 4th degree blood circulation impairment does not preclude surgical treatment of mitral stenosis, because an effective commissurotomy is often followed by a marked improvement of the patient's condition and even by partial fitness for work.
